Bessel functions, first defined by the mathematician Daniel Bernoulli and then generalized by Friedrich Bessel, are the canonical solutions $y(x)$ of Bessel's differential equation $x^2 y'' + x y' + (x^2 - \nu^2) y = 0$ for an arbitrary complex number ν , the order of the Bessel function. Although ν and $-\nu$ produce the same differential equation for real ν , it is conventional to define different Bessel functions for ...

In probability theory, the central limit theorem (CLT) establishes that, in some situations, when independent random variables are added, their properly normalized sum tends toward a normal distribution (informally a "bell curve") even if the original variables themselves are not normally distributed. The theorem is a key ("central") concept in probability theory because it implies that ...

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

Mathematical Tools for Physics

Time-driven quantum systems are important in many different fields of physics like cold atoms, solid state, optics, etc. Many of their properties are encoded in the time evolution operator which is calculated by using a time-ordered product of actions.
