The RGB color model is an additive color model in which red, green and blue light are added together in various ways to reproduce a broad array of colors. The name of the model comes from the initials of the three additive primary colors, red, green, and blue.. The main purpose of the RGB color model is for the sensing, representation and display of images in electronic systems, such as ...

sRGB (standard Red Green Blue) is an RGB color space that HP and Microsoft created cooperatively in 1996 to use on monitors, printers, and the Internet. It was subsequently standardized by the IEC as IEC 61966-2-1:1999. It is often the "default" color space for images that contain no color space information, especially if the images' pixels are stored in 8-bit integers per color channel.

You can obtain a wide range of colors, but not all the colors the eye can see, by combining RGB light. The gamut of colors a device can reproduce depends on the spectrum of the primaries, which can be far from ideal. To complicate matters, the eye's response doesn't correspond exactly to R, G and B, as commonly defined (the description above is oversimplified).

Gamma correction is one of several functions of RAW conversion-- the process of converting the output of an image sensor to a standard file format, such as JPEG or TIFF. Depending on your camera's Storage or Quality setting, RAW conversion takes place inside the camera, immediately after the exposure, or afterwards on a computer.
